

Instructions & Safety Information

PLEASE DO NOT USE ELASTITONE PRODUCTS UNTIL YOU HAVE READ & UNDERSTAND THESE INSTRUCTIONS FULLY, AS YOU MAY INJURE YOURSELF AND/OR DAMAGE THE BANDS IF YOU DO.

As with all exercise and gym equipment, it should be checked before every use for

Defective/damaged parts to ensure you do not become injured during use.

If you let somebody other than yourself use you ElastiTone equipment, please make sure they read the below info full before doing so, or repeat the information to them.

Product Safety Information

People with latex allergies will probably be able to use these bands as they are covered in a sleeve, however it is best to check with your doctor first.

Be sure the resistance band or tubing is securely anchored or clipped to a sturdy object or attachment before using. If standing on a band, make sure the band is in the centre of the sole of your foot, as the band may become loose and hit you if it is not.

Safety goggles.

In the past when selling non sleeved bands it was recommended to wear safety goggles when performing exercises that may result in the band snapping and hitting a user in the eye. With a sleeve I honestly cannot see how this could happen, however for legal reasons it is still recommend you use them if you are performing movements with the band in such a position that it may hit you in the face.

Even if the band did brake, the sleeve should stop it hitting you, but there are still other things that could occur. For example somebody could open your door without warning, which could cause the anchor or band to come loose and hit you.

Obviously this is not a common occurrence and I am yet to hear of this ever happening, but ElastiTone is not responsible if it does.

Other things should also be considered, such as if you accidentally let go of a handle, or perhaps a defective component causes a handle to come loose (there have been no reports of this so far), any nearby objects could be broken, and people standing nearby could get hurt, so do not workout with bands close to expensive vases or windows or children for example! Of course this is just common sense, ElastiTone is not responsible for any damages or injuries if such things occur, no more than York would be responsible if you dropped one of their weights on your foot or your mobile phone...

IMPORTANT: Before standing on or anchoring the bands, you must take note of the following.....

If you find that the sleeve stops you from stretching the band as far as you should be able to (normally only a problem with the overhead press), follow the below steps...

With the sleeve as evenly spread across the band as you can get it, place your hands at either side of the centre of the band as show in the image below...

Now move your hands apart whilst holding the nylon, so that it straightens out along the band and is not bunched up, as shown below.

Take your hands as wide as you can, so that most of the sleeve becomes bunched up at the ends of the band and not so much in the middle. It will probably still be slightly bunched up.

The reason for doing the above is so that you are not stood upon or anchoring bunched up nylon, because if you do you will not be able to stretch the band very far as the nylon may prevent it, which is a pain for exercises like the overhead press.

Note regarding the Overhead / Military shoulder press...

You should never use a wide foot spacing when doing the overhead press, as you will not be able to press the band very far if you do. Ideally you should stand with your feet about 10-15cm apart if you are short. Taller users may need to use just one foot on the band, OR use a "split squat" (knees bent with one foot in front of the other) position, which is what most brands recommend.

You can also simply extend the length of the band by using the adjustable ankle straps looped through the rings on the band, as pictured below. This is by far the best method.

You could even use a length of chain looped through the ring on the band and clipped to the handle if you choose.

All of these methods will allow more length for doing the overhead press. Be sure to use strong chain to prevent it breaking.

Door Anchor /Jammer Instructions:

Open the door, place the foam end of the anchor outside the room you are going to be working out in, and close the door.

Now place your band through the loop in the end of the door anchor, as below. It is now ready for you to use!

The anchor is best used so that when you pull it, the door is being pulled towards the closed position, which for most people will be in the hallway, since most doors open inwards. However if you cannot do this, or do not want to do this, make sure you jam the door shut with a door wedge or lock the door. It is also best to use the anchor close to or in the hinged side of the door, as there is less chance it will open.

NEVER use a door that could come open during use or an anchor point that could become loose or unstable.

Also always let people know you are using the door before you begin so that they do not open the door!

There is also a carabiner hook on the end of the door anchor, you can attach bands to this for things such as resistance running, with an ankle strap attached to the back of a belt etc. Other than this the hook is not needed and can be removed and kept as a spare.

Loop anchor instructions.

Just wrap the loop anchor (sold separate) around a tree or post for example, thread one end loop through the other end loop, pull tight and then thread bands through the loop the same way as you would the door anchor.

Exercises

For exercise examples, there are hundreds if not thousands online, in both video and chart format, and all bands work the same just like all free weights work the same, so you can watch any video or follow any instructions from any brand or any person and it will still apply to ElastiTone bands. There is no need for me to repeat what has already be done and shown many many times.

A collection of the best videos can be found at <http://www.elastitone.com/ResistanceBandExercises.html> or simply do a google web search, google image search or google video search.

Health & Safety Legal Disclaimer: All information and content on the ElastiTone website is not intended to be a substitute for advice by a qualified personal trainer or healthcare professional. If you suffer from a health problem or injury that could affect your ability to exercise then you should consult a qualified healthcare professional before using any exercise equipment or routine.

As with ALL exercise equipment, there is always a chance the user or people around the user may become injured during use. By purchasing from ElastiTone.com you agree that nobody associated with ElastiTone.com may be held liable for any injuries or damage to you, others around you, or to objects and property, which may occur from the use of the equipment sold on this site, or the videos and instructions seen on this site, regardless of how or why the injury or damage occurred.

It is the user's responsibility to check all equipment for defects before each and every use. ElastiTone.com uses high quality parts and components to prevent such things occurring but all equipment should still be checked to be safe. You should also make sure that you or the intended recipient have read and fully understand the instructions provided on this site before use.

Thank you!
